Summary

The experiments were carried out in Phu Ninh district, Quang Nam province. The purpose of this study was determining of the planting time of Quinoa, in two winter-spring crops, 2015-2016 and the Summer-season 2016. The experiment was designed in randomized complete block (RCBD) with 3 formulas corresponding to 3 different planting times, replication 3 times for each. The study results showed that the planting time is affect on productivity of Quinoa. The average yield of summer-autumn crop is higher than that of spring-winter crop of 3.5 quintals per hectare. Summer crop (22/6/2016) yield reached 6.1 quintals per hectare. Winter-spring crop (14/02/2016) yield reached 1.9 quintals per hectare.
